# TABLE OF PLATES

Plate 1.1. Oblique aerial view south along the Illawarra Escarpment. Taken by the writer in December 1990, Scarborough Railway Station and Lawrence Hargrave Drive in the foreground. ................................. 1-1
Plate 2.1. Oblique aerial photograph of the Thredbo Landslide, which occurred at approximately 11.30pm on the 30th July 1997. Photograph courtesy of the Canberra Times, picture by Gary Schafer. ........................................................................................................................................ 2-2
Plate 2.2. Vertical aerial photograph of the Coledale Landslide which occurred on the 30th April 1988. Photograph courtesy of the New South Wales Railway Services Authority. .................................................................................................................. 2-3
Plate 2.3. The Mount Barrengarry Landslide occurred in the early morning of the 29th June 1997, during heavy rainfall. The rock fall involved approximately 6000m$^3$ of Hawkesbury Sandstone bedrock. The ensuing debris flow also involved approximately 15000m$^3$ of additional colluvium on the slopes below (underlain by Kangaloon Sandstone). The debris flow completely destroyed up to 2Ha of dense forest. The toe of the flow stopped several metres upslope of the Fitzroy Falls to Kangaroo Valley Road ..................................................................................................................................... 2-9
Plate 3.1. April 1997 vertical aerial view of the Seafoam Avenue and Thirroul Public school landslide. The vacant lots which used to be occupied by houses that were destroyed by the landslide are clearly visible. ........................................................................................................................................... 3-31
Plate 3.2. April 1997 view to the southeast over the reconstructed Coledale railway embankment. .............................................................. 3-39
Plate 3.3. A debris slump near the top of Macquarie Pass occurred on Friday 14th February 1997, at approximately 12.30am during heavy rainfall; (a) The rear main scarp and damage to the pavement of Macquarie Pass, (b) The debris slump viewed from below. ................................................................................................................................. 3-43
Plate 3.4. Remedial works comprised of a retaining wall constructed with gabion baskets to repair a debris slump near the top of Macquarie Pass. The remedial works cost $250,000 and were completed in approximately 3 weeks. ................................................................................................................................. 3-44
Plate 3.5. Vertical aerial view of Lawrence Hargrave Drive between Clifton and Coalcliff, the northern amphitheatre. .................................................................................................................................................. 3-44
Plate 3.6. Vertical aerial view of Lawrence Hargrave Drive between Clifton and Coalcliff, the central amphitheatre. Note rock fall and debris flow paths. ........................................................................................................................................ 3-46
Plate 3.7. Oblique aerial view to the northwest over Lawrence Hargrave Drive between Clifton and Coalcliff, the southern amphitheatre. Hanlon referred to this area as ‘Clifton Hill’. .................................................................................................................. 3-45
Plate 3.8. One of several dramatic landslides, a debris slump, which closed Lawrence Hargrave Drive between Clifton and Coalcliff in 1988 (Construction Australia 1988). ........................................................................................................................................ 3-46
Plate 3.9. Slot drainage remedial works underway to repair a landslide on Lawrence Hargrave Drive between Clifton and Coalcliff, 1988 (Construction Australia 1988). ........................................................................................................................................ 3-46
Plate 5.1. Pavement damage indicating the possible initial development of land instability; (a) Site 225. Pavement distortion and cracking in Mount Kiera Road, above the Scout Camp access road, (b) Site 229. Pavement cracking in Mount Kiera Road. The shape of the cracking suggests more than reactive soil movement. Bitumen paint has been applied to reduce ingress of water. .............................................................. 5-4
Plate 5.2. Site 128, Alanson Avenue, Bulli. South side of road, mid to eastern end; (a) Bowman (1972) Plate 8, Figure 1, page 222. Undated but pre December 1972, and post Alanson Avenue road construction. Viewed from western end, looking east., (b) Young (1976), page 219. Viewed from eastern end, looking west. ........................................................................................................................................ 5-5
Plate 8.1. Site 26, Oblique aerial photograph taken by the writer December 1997 ......................... 8-13
Plate 8.2. Site 26, Pavement cracking along intermediate scarp in Lawrence Hargrave Drive. Photograph taken on 15th June 1991, at 7.00am, 3 days after the record 12th June 1991 rainfall event ................................................................................................................................. 8-14
Plate 8.3. Site 142, Oblique aerial photograph taken by the writer, dated 12th April 1992 ............. 8-45
Plate 8.4. Site 145 NSW Lands Department Black and white vertical aerial photograph dated 20th November 1966. Run 12, Frame 1471, roll 5190. Enlarged here to an approximate scale of 1:2500 ... 8-54

Plate 9.1. Two oblique aerial photographs of the Scarborough Landslide suite area, February 1997; (a) Taken from above the KCC emplacement looking southeast, (b) Taken from above the intersection of Lawrence Hargrave Drive and Morrison Avenue, looking north ........................................ 9-5

Plate 9.2. Two vertical aerial photographs, centred on site 64, taken by the writer in; (a) December 1991, prior to the installation of remedial works, and (b) October 1992, shortly after the completion of remedial works ........................................................................................................................................ 9-6

Plate 9.3. Vertical aerial photograph of site 63, the KCC emplacement, taken by the writer in April 1997 ................................................................................................................................................... 9-7

Plate 9.4. Vertical aerial photograph of site 65, the RTA’s landslide near the intersection of Fifth Avenue and Lawrence Hargrave Drive, taken by the writer in April 1997 .............................................. 9-7

Plate 9.5. Site 77, vertical aerial photograph, taken by the writer in December 1997. ...................... 9-43

Plate 9.6. Site 77, Damage to the bitumen pavement of Morrison Avenue, centre of the site April 1990. Note the variable inclination of the power poles and the variable wire tension between the two spans ........................................................................................................................................ 9-45

Plate 9.7. Site 77, Damage to the bitumen pavement of Morrison Avenue, north end of the site April 1990. Note the break of slope beyond the tension cracks ................................................................. 9-45

Plate 9.8. Site 77. Profuse development of minor scarps and transverse cracks during the 1974 failure ..................................................................................................................................................... 9-48
