 - Pain, Cardiac and Major multiple trauma.....96
 - Other disabling impairments.....104
- Contact AROC.....110

This is the 18th comprehensive annual report describing discharge episodes from subacute inpatient rehabilitation programs provided by Australian facilities that are members of the Australasian Rehabilitation Outcomes Centre (AROC).

The inaugural report described inpatient episodes discharged in 2005; this report describes those discharged in 2022.

This report uses the version 5 AN-SNAP classification (implemented in Australia in July 2022). For more information about AN-SNAP classification please refer to the AROC website: <http://ahsri.uow.edu.au/aroc>

This report also includes an extended times series analysis, looking at change in various rehabilitation measures over the most recent five years.

Like most things in 2020 the provision of rehabilitation in Australia was impacted by COVID-19. Following temporary suspension of elective surgeries, ward re-assignments and closures, and fewer traumatic accidents there was a 10% decline in the number of rehabilitation episodes in 2020 compared to previous years. However the key outcomes of length of stay and functional improvement were unaffected.

Number of episodes by impairment group, 2022

Proportion of episodes by impairment and sector, 2022

Funding source for rehabilitation in Australia, 2022

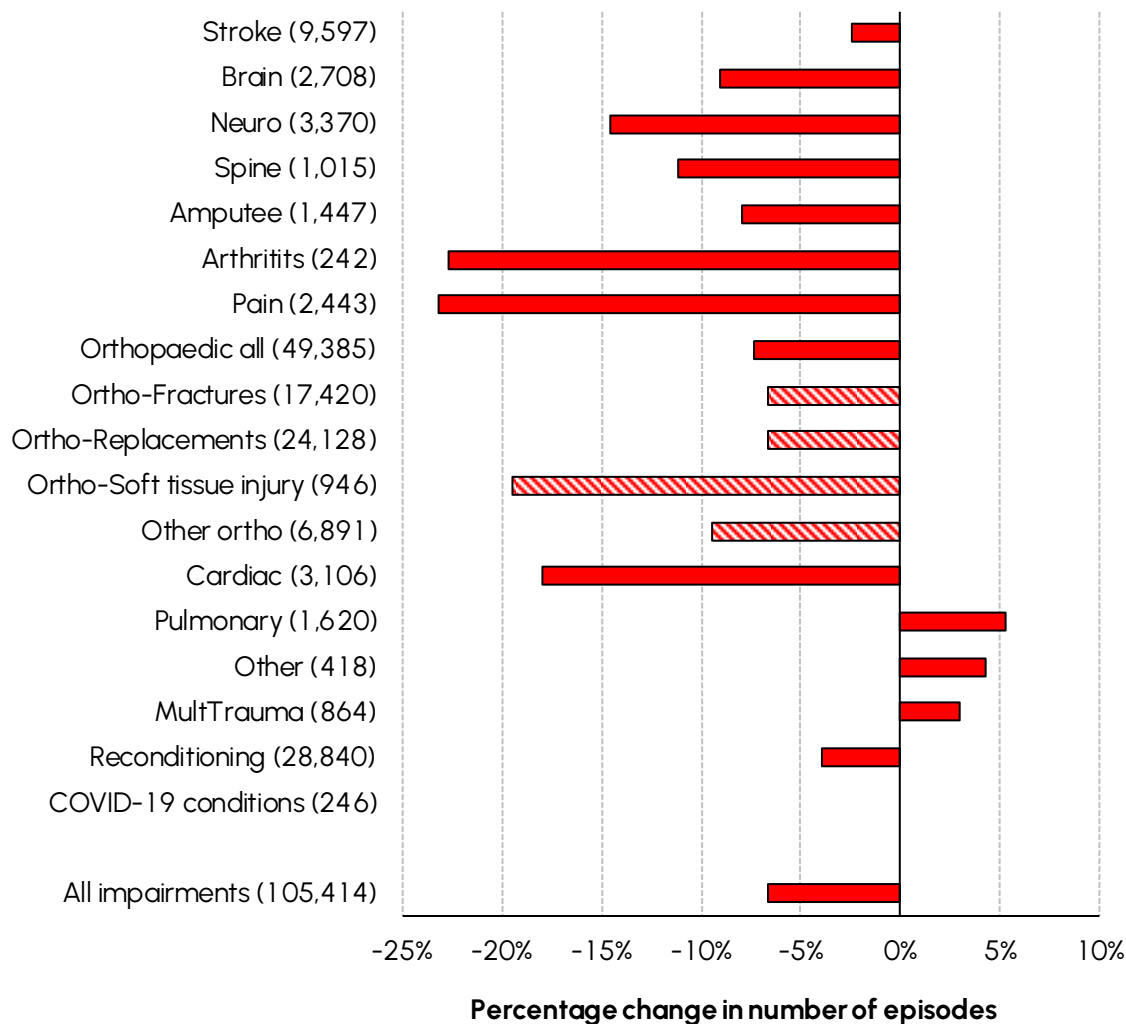

Changes in rehabilitation – compared to last year

The following figures look at changes in rehabilitation between last year and this year:

- The first figure considers the number of episodes within each impairment group and documents real changes in episode volume since last year.
- The second figure presents the key changes in rehabilitation outcome measures between last year and this year. The horizontal axis describes the difference between last year and this year averages, while last year's actual values are presented on the left side of the graph.

Change in number of episodes by impairment group, 2021 to 2022

Changes in rehabilitation – compared to five years ago

The following figures look at changes in rehabilitation over the last 5 years:

- The first figure outlines the changing proportion of episodes within each impairment group over the past five years as a proportion of all episodes each year.
- The second figure presents the key changes in rehabilitation outcome measures between five years ago and this year. The horizontal axis describes the difference between five years ago and this year's averages, while the actual values from five years ago are presented on the left side of the graph.
- The remaining figures provide a graphical representation of the change in various rehabilitation measures over the most recent five years. Each bar (one per year) represents the difference, positive or negative, of that year's value to the value from five years ago. The value for the bar from five years ago will always be zero.
 - Age at admission
 - Admission to rehabilitation within a week of injury or onset of symptoms
 - Length of stay
 - Timeliness of FIM assessment within 24 hours
 - Admission FIM scores as a proportion of the total score possible
 - Relative functional gain in FIM
 - FIM efficiency per week

Proportion of episodes by impairment group, 2018 to 2022

Change in outcome measures, 2018 to 2022

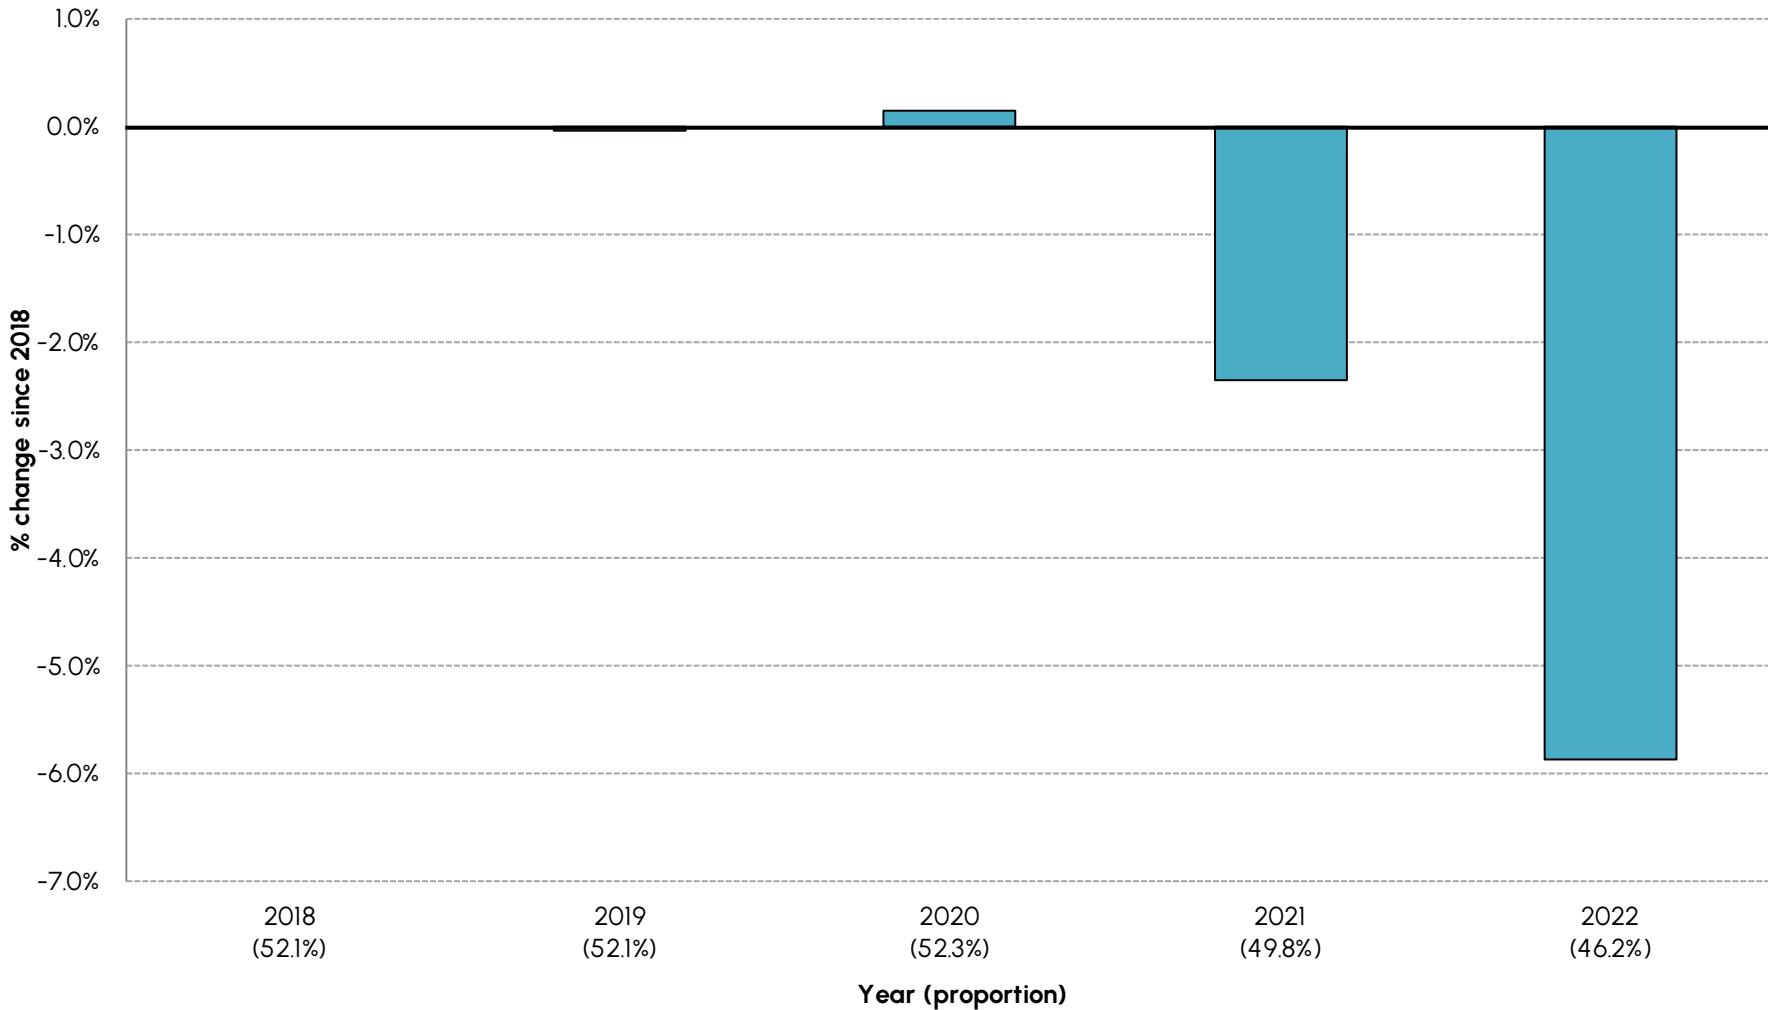

Average age compared to five years ago

Over the last five years patient age has very slightly increased, from 74.4 in 2018 to 75.0 in 2022.

Admission to rehabilitation within a week of injury or onset of symptoms compared to five years ago

Pre-COVID half of all patients commenced rehabilitation within a week after their injury / onset of symptoms; the proportion has decreased in the last two years with 6% fewer patients in 2022 admitted to rehabilitation within a week of onset compared to pre-COVID.

Length of stay compared to five years ago

Pre-COVID rehabilitation length of stay (LOS) had been consistently around 17 days; since COVID LOS has increased slightly with patients in 2022 staying a day longer.

Timeliness of FIM assessment within 24 hours compared to five years ago

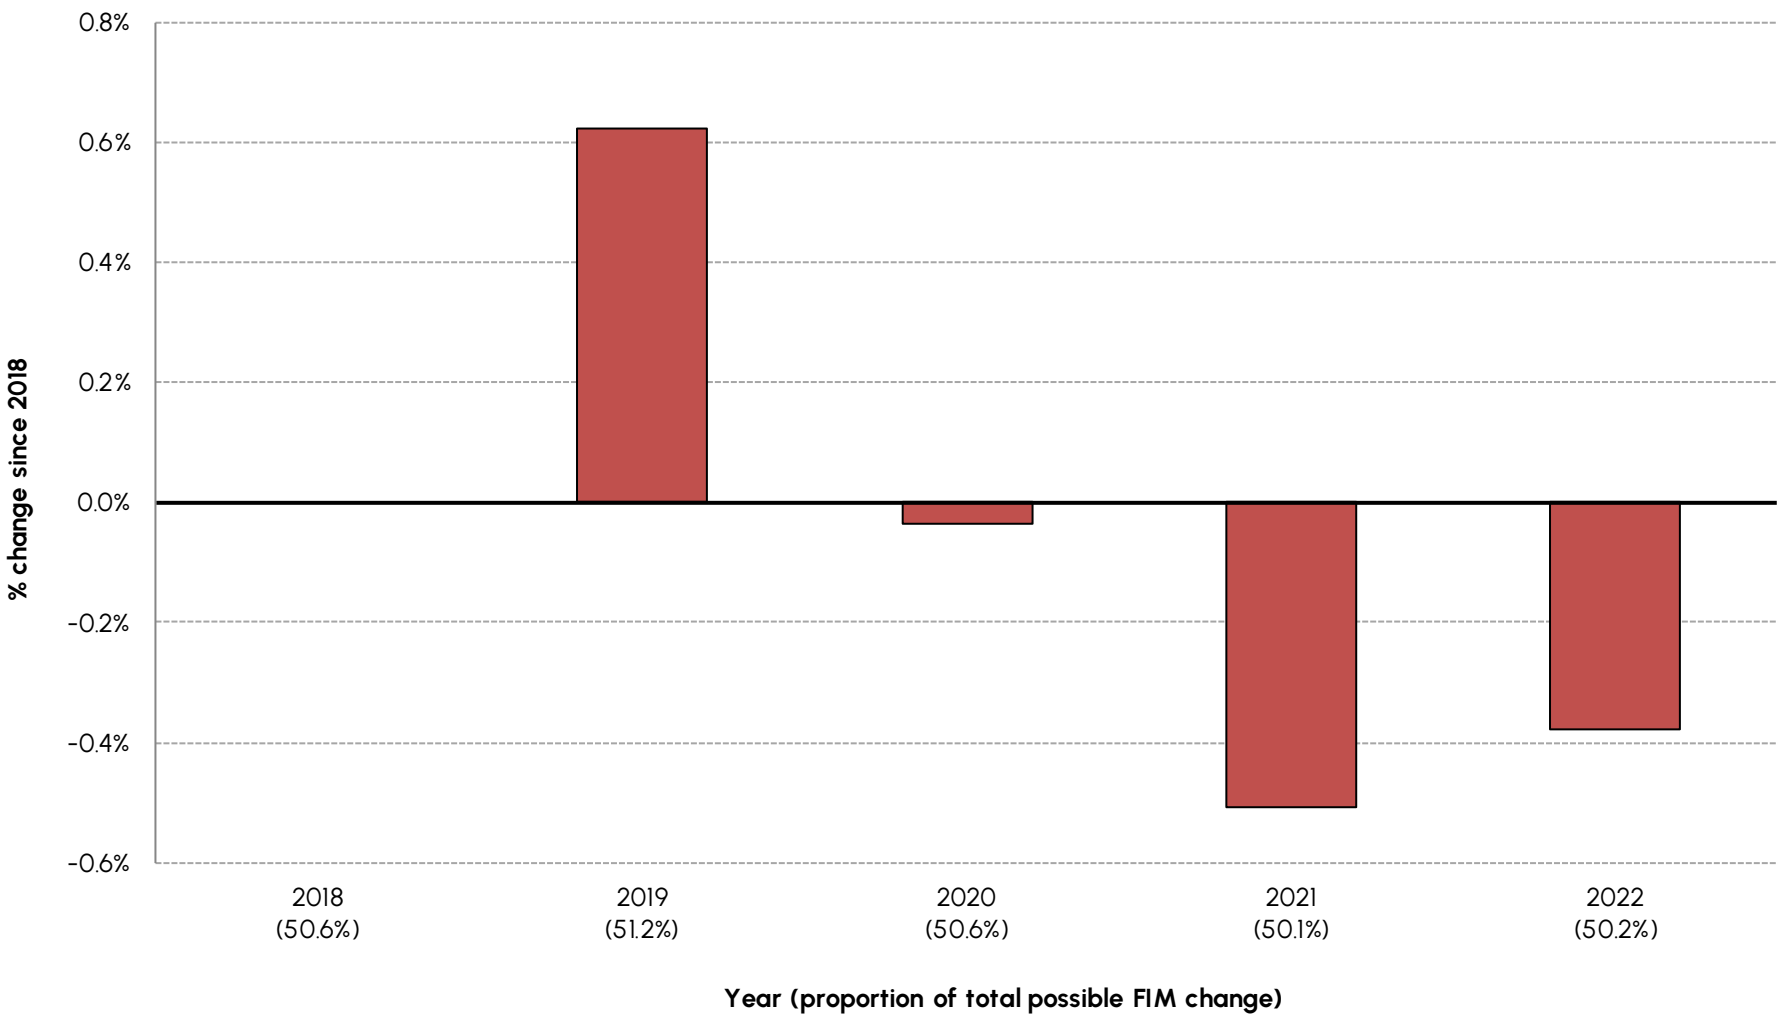

Over the last five years the proportion of patients assessed for their functional ability within 24 hours of rehabilitation has sat around 90%.

FIM scores at admission as a proportion of total possible compared to five years ago

Over the last five years the FIM admission score has continued annually to decline slightly, being 2.1% lower in 2022 compared to in 2018.

Relative functional gain in FIM compared to five years ago

FIM Relative Functional Gain (RFG), or change in FIM score possible from admission to discharge, has remained at around 50% functional gain achieved over the past five years.

FIM efficiency per week compared to five years ago

Over the last five years weekly FIM efficiency (change in FIM score possible from admission to discharge divided by length of stay x7) has not changed significantly although the trend has been for it to decrease since COVID; in 2022 it was marginally lower than it was in 2018. The pattern in FIM efficiency from 2018 to 2022 is in keeping with the observed LOS and FIM change over this period.

A series of figures and tables are provided for each impairment group; these outline the key descriptive data for this year, changes in episode volumes over the last 5 years, and changes in rehabilitation outcome measures between last year and this year:

- The first figure in each group outlines the number of episodes for each quarter over the past five years, and documents any changes in episode volume over time and/or seasonal trends.
- The second figure displays the proportion of episodes in each AN-SNAP class over the last 5 years.
- The third is a table outlining key data for the respective impairment group by AN-SNAP class.
- The fourth figure provides a summary of the discharge destination of all episodes by AN-SNAP class.
- The fifth figure provides a graphical representation of length of stay (LOS) and improvement in the FIM (Functional Independence Measure) by AN-SNAP class.
- Finally, the sixth figure presents the key changes in rehabilitation outcome measures between last year and this year. The horizontal axis describes the difference between last year and this year averages, while last year's actual values are presented on the left side of the graph.
