Title: Design and Analysis Issues for the Health Connect Study

Abstract: The Illawarra Health and Medical Research Institute is planning to conduct the Health Connect study. This study is aimed at improving the population weight profile over 3 year in the Illawarra and Shoalhaven Health District. The study includes a Randomised Control Trail embedded in a longitudinal survey. It is hoped to evaluate a treatment implemented at the individual level as well as assess the impact of community level activites. This talk will outline some of the issues involved in developing statistical design and analysis options for this study.
